# Impact of financial regulation on growth

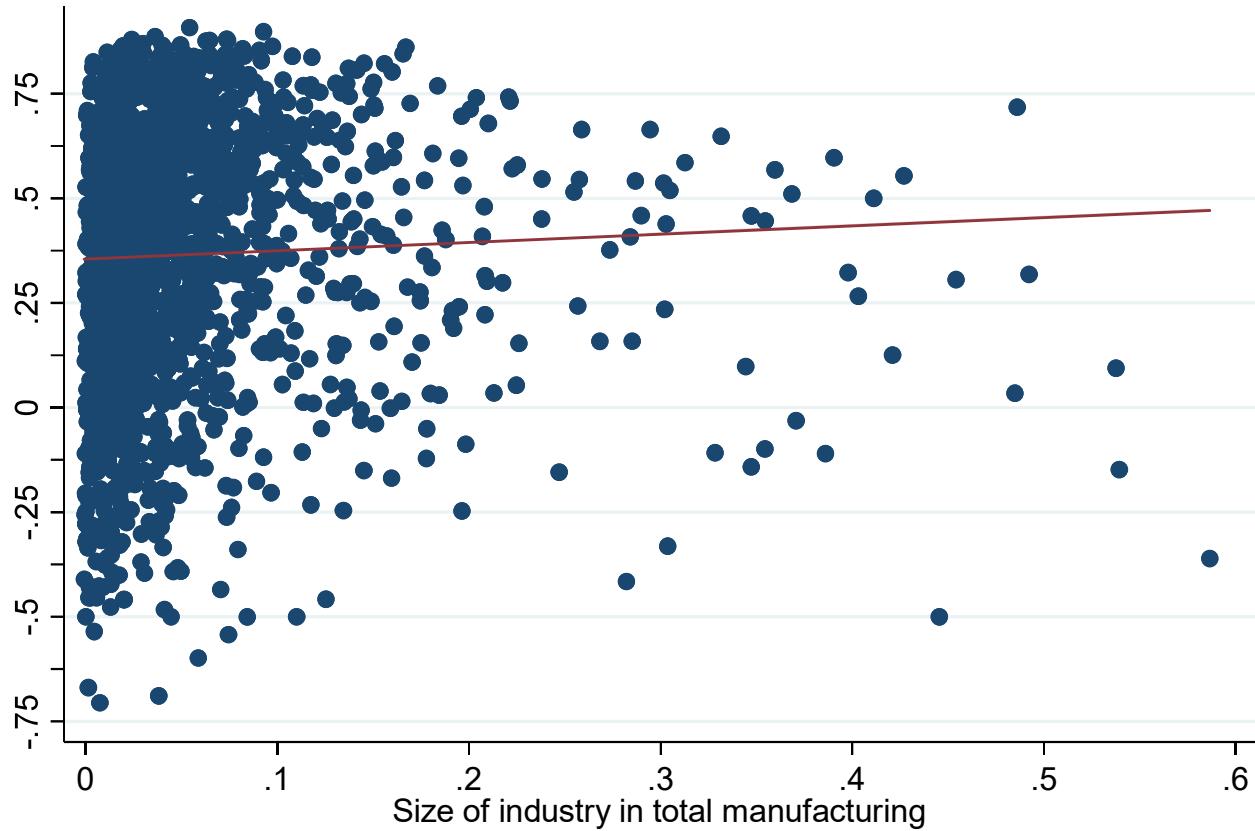

- Recent studies show a negative impact of macroprudential policies (MaPPs) on the growth of housing prices, mortgages, total credit, household credit and corporate credit (Cerutti, Claessens and Laeven 2017, Akinci and Olmstead-Rumsey 2018). Non-financial effects are still understudied with no clear effect on GDP (Alam et al. 2019).
- Rajan and Zingales (1998)** find that industrial growth (industry-country panel, UNIDO) is positively affected by the interaction of the industry's **external finance dependence** (measured as the median firm value of  $\frac{\text{Capital Expenditures} - \text{Cash flow}}{\text{Capital Expenditures}}$  in each US industry in the 1980s) with the country's financial development (Domestic credit to private sector over GDP).
- Past (Braun and Larrain 2005, Raddatz 2006, Cowan and Raddatz 2013):  $EXFD_i \times \{FD_c; R_{c,t}; SS_{c,t}\}$ . **Today:**  $EXFD_i \times MaPP_{c,t}$ .

- I test the impact of the MaPPs (IMF: Alam et al. 2019) on the Index of Industrial Production growth ( $g_{i,c,t} = \ln(\frac{IIP_{i,c,t}}{IIP_{i,c,t-1}})$ ) of 93 countries and 23 manufacturing industries (UNIDO: Indstat2) for the period 1990-2016 (annual).  $PP_{c,t}$  is the net tightening actions in a period. Cumulative policy impact:  $CPP_{c,t} = \sum_{j=1990}^t PP_{c,j}$ .
- $g_{i,c,t} = \beta [PP_{c,t}, CPP_{c,t}] + \gamma EFD_i [PP_{c,t}, CPP_{c,t}] + \delta x_{i,c,t} + f_{i,c} + f_t + \varepsilon_{i,c,t}$
- Identification (MaPP exogeneity): Manufacturing is just 11.1% of the GDP for the median country, therefore each of the 23 manufactures has no impact on the regulatory decisions. OLS-FE; QREG-FE; BB-FE (Blundell-Bond 1998). Can add  $f_{i,t}$ .

# MaPPs in the study

- 17 MaPPs of different types (vector  $PP_{c,t}$ ).
  - Loan Demand: LTV + DSTI
  - Loan Supply: Limits on Credit Growth (LCG) + Loan Loss Provisions (LLP) + Loan restrictions (LoanR) + Limits and penalties to the loan-to-deposit (LTD) + Limits on foreign currency lending (LFC)
  - **Loan Sum** ( $LPP_{c,t}$ ) = Loan Demand + Loan Supply
  - Supply general = RR + Liquidity + Limits on foreign exchange exposure (LFX).
  - Supply capital = Unweighted Leverage Ratio (LVR) + CCB + Conservation buffer + Capital requirements
  - **Supply Sum** ( $SPP_{c,t}$ ) = Supply general + Supply capital
  - **Institutional Sum** ( $OPP_{c,t}$ ): Tax + SIFI + Other (ex: stress tests, limits on dividends)
- Total MaPPs ( $TPP_{c,t}$ ) = Sum of Loan + Supply + Institutional

# Conclusions

The growth of industries with high external financial dependence is negatively affected by Macroprudential policies, whether through the cumulative policy stance or newly introduced policies.

The effect is stronger in periods of high growth (q75, q90).

Impact higher on AEs and EMs (impact is higher on LICs' industries, but LICs have fewer industries with high external dependence).
